DESCRIPTORS- *HOME ECONOMICS EDUCATION, *STUDENT TEACHING, *BEHAVIOR RATING SCALES, STUDENT TEACHERS, *TEACHER BEHAVIOR, *TEACHER EVALUATION,

CRITICAL INCIDENTS REFLECTING OUTSTANDINGLY EFFECTIVE BEHAVIOR IN STUDENT TEACHING OF HOME ECONOMICS WERE COLLECTED FROM COLLEGE SUPERVISORS, COOPERATING TEACHERS, AND STUDENT TEACHERS AND CATEGORIZED ACCORDING TO SPECIFIC BEHAVIORS, AND PROVIDED A BASIS FOR CONSTRUCTING A RATING SCALE FOR EVALUATING STUDENT TEACHING PERFORMANCE. THE CRITICAL BEHAVIORS WERE USED TO DESCRIBE QUALITY LEVELS ON A FIVE-POINT CONTINUUM OF 112 UNIDIMENSIONAL ITEMS. ANALYSIS OF THIS SCALE, RS-112, BY THE DARLINGTON PROCEDURE WITH STUDENT GRADES AS CRITERION MEASURES RESULTED IN A SCALE, RS-35, 35-ITEM WITH AT LEAST ONE ITEM IN EACH OF 10 MAJOR BEHAVIOR CATEGORIES. USE OF THE RS-35 GAVE A BETTER DISTRIBUTION OF RATINGS THAN RS-112. THE MAJORITY OF COOPERATING TEACHERS AND COLLEGE SUPERVISORS REPORTED USING A RATING SCALE. ABOUT HALF PREFERRED RS-35 TO RS-112 AND OVER HALF LIKED IT BETTER THAN THEIR PRESENT INSTRUMENT. MOST REPORTED A 20-MINUTE TESTING TIME. TWO-THIRDS SAID THEY WOULD USE THE RATING SCALE, IF AVAILABLE. MORE THAN HALF OF THE STUDENT TEACHERS FELT THAT IT PROVIDED AN IMPORTANT OBJECTIVE BASIS FOR LOOKING AT THEIR BEHAVIOR. RECOMMENDATIONS CONCERN (1) REFINING THE SCALE, (2) DIFFERENTIATING MORE CLEARLY BETWEEN LEVELS 3 AND 5, (3) USING THE FIVE ITEMS EMERGING FROM MULTIPLE REGRESSION ANALYSIS FOR A SHORTER RATING SCALE, (4) INCLUDING A PLACE FOR RATER COMMENTS ABOUT STUDENT TEACHER GROWTH, AND (5) USING THE SCALE AT THE MIDDLE AND CONCLUSION OF STUDENT TEACHING. BOTH SCALES, OPINIONNAIRES, CATEGORIES OF STUDENT BEHAVIOR, AND THE INFORMATION FORM FOR REPORTING CRITICAL INCIDENTS ARE INCLUDED. (FP)

INTRODUCTION

The student teaching experience affords the opportunity to develop competencies inherent in effective teaching. The professional supervision of student teachers is an attempt to give direction to this experience. Evaluation of student teacher performance, i.e. the student teaching grade, provides an index of effective teaching and, to this extent, evaluation can be used to clarify objectives and improve role competency. A valid and reliable evaluation device contributes to the efficacy of assessment and therefore to the fulfilment of student teaching goals. Current literature reveals that there is a dearth of such instruments and that many educators are dissatisfied with present patterns of evaluation of student teaching.

Purpose and Nature of the Research

In an attempt to facilitate the process of student teacher evaluation in home economics, a study was designed to determine by means of the critical incident technique the performances contributing to effective and ineffective student teaching behavior, and to construct a rating scale to evaluate those performances. The critical incident technique employs collected reports of effective and ineffective behavioral patterns as they relate to the aim of the activity being analyzed. The present study used this means to identify student teacher behaviors related to and reflexive in effective or ineffective teaching. Based on the categorized incidents, descriptions of unidimensional student teacher behavior were written and assembled in rating scale form. It was expected that the rating scale would thus describe student teacher behaviors which are significant in the performance of the student teacher.

Following independent use of the rating scale by cooperating teachers, student teachers and college supervisors, analysis of the data was executed using the student teaching grade as the criterion measure of student teaching erformance. The theoretical work of Thorndike (30) and the implementation of this by Darlington (14) provided the base for the test analysis. Regression analysis predicting the student teaching grade from the rating scale items was performed.

A second stage rating scale composed of those items from the preliminary scale statistically determined to be the most important indicators of student teaching performance, was formulated and administered to a second sample for purposes of cross validation. This instrument was tested and its reliability and usefulness as an evaluative device in the student teaching experience were assessed. The reliability of the instrument was

determined by inter rater, split-half, and item discrimination methods. The usefulness of the rating scale was investigated through administration of two opinionnaires, one designel for student teachers, and one for cooperating teachers and college supervisors.

The study was limited to evaluation of student teachers in home economics, and evaluation was restricted to the use of a rating scale at the end of the student teaching experience. Operational definitions of terms used in this report may be found in the glossary.

Related Research

In reviewing literature relevant to the topic of this study, five areas were covered: (1) evaluation of student teaching in home economics, (2) evaluation of student teaching in general, (3) teacher effectiveness, (4) the critical incident technique, and (5) rating scales.

Student Teaching in Home Economics. Studies of evaluation of student teaching in home economics have centered on surveying practices and instruments used to assess the effectiveness of student teaching (10) and the effect of such upon the student teacher (27), construction of scales based on the opinions of qualified teacher educators or cooperating teachers as to the aspects of teaching necessary to measure (33), and evaluation of the performance of instruments (15).

Student Teaching. In the literature on student teaching in general, there is considerable evidence of dissatisfaction with methods of evaluation (28; 11) and some attention to identification of needs in the area of evaluation (21). Analyses of existing rating scales for the evaluation of student teaching have been carried out (5; 34). Personality characteristics of inferior and superior student teachers were delineated (32; 29; 23). Student teachers were evaluated in terms of strengths and weaknesses (26), and a study was conducted inquiring as to what school administrators desired to know about a prospective teacher employee (25).

Teacher Effectiveness. In reviewing literature on teacher effectiveness three basic approaches to its measurement were identified: evaluation of pupil growth, evaluation of teacher qualities thought to influence the teaching-learning process, and appraisal of the teaching process. The measurement of teacher effectiveness has been plagued by the problem of validity of the criterion of teaching effectiveness. Some researchers feel that consensus of authorities in the field

is the best procedure (3) while others are investigating objective measures (2; 13). As yet, none of the objective means seems to have value for appraisal of student teaching. Measurement of teacher qualities thought to influence the teaching-learning process has usually taken the form of a rating scale formulated by teacher educators (1; 35; 19). Appraisal of the teaching process has involved measurement of classroom behavior quantitatively and by rating devices (6; 22). The teaching process seems most readily evaluated through the analysis of teaching behavior since behaviors can be observed and personality as it enters behavior can also be assessed (22; 8). Results of these studies in general have yielded inconclusive evidence about teacher effectiveness.

Critical Incident Technique. The critical incident technique involves the identification of behaviors that are either outstandingly effective or ineffective as the individual performs the job under scrutiny. This methodology has been used extensively in the analysis of many jobs and provides information regarding the requirements of a position (16). Although Flanagan suggested the technique requires only simple judgments on the part of the qualified observer, and thus is easy to use, Mayhew (20) pointed to some difficulties in using the critical incident technique. Advantages of this method are its provision of actual materials for use, and valid bases for construction of evaluation instruments. A study by Blank (9) employed the critical incident technique to determine characteristics of effective and ineffective teaching of physical education instructors.

Rating Scales. The rating scale classified as graphic was used in this ctudy. Such a scale consists of a continuum presented to the subject with preassigned bench marks, to be marked according to the rating deemed most accurate. This form of rating scale is felt to be simple and easy to administer, interesting and quick to work with (17). Criticism of rating scales have included lack of satisfactory validity criteria, subjectivity, and difficulty of establishing the validity of the total rating. Use of critical incident material based on student teacher's observed behavior took care of the validity criticism; subjectivity was handled by attempting to define as precisely as possible the dimension of the student teaching experience to be rated; validity of the total rating was investigated by correlating the summed scale scores with student teaching grade. In that a rating scale is geared to standardize both what is observed and how it is appraised, it is felt that this is the most useful instrument for securing a quantitative appraisal of student teaching (4).

Because student teaching is asserted to be the most important experience in teacher preparation, the scarcity of literature on the evaluation of student teaching was unexpected. The problem of evaluating student teacher performance is complicated by the fact that researchers have not reached definitive conclusions about teacher effectiveness. Rating scales appear to be the best method of evaluating student teachers' performance, and the critical incident technique seems to hold promise for indicating the behaviors of the student teacher that should be evaluated in this manner.

METHOD

The major problem with which this study was concerned was the construction of a rating scale to serve as a summary evaluation of home economics student teachers' performance in student teaching. Flanagan's critical incident technique was utilized as the means by which data on actual effective and ineffective behaviors of student teachers were secured and thereafter utilized as a valid base for the construction of the scale.

Sample and First Data Collection. Colleges and universities preparing home economics teachers in New York State, the New England States, Pennsylvania, New Jersey, Ohio, Indiana, Tennessee, Kentucky, and West Virginia were asked to cooperate in this research. (See appendix for list of participating institutions and letter to participants.) Cooperating teachers, college supervisors and student teachers of 20 institutions participated in the collection of critical incidents during May 1965, and from October 1965 through February 1966. (Materials used in the collection of critical incidents are appended.)

Analysis of Critical Incidents. All critical incidents received were analyzed to separate out single specific behaviors; the behaviors were then classified into ten major categories that emerged as the incidents were studied. A randomly selected 15 percent of the incidents were submitted to a panel of five home economics teacher educators who classified them according to the ten categories. The majority agreement of the consultants was used as the accepted categorization for the incidents reviewed. (The appendix contains a list of the categories of student teacher behavior derived from the critical incidents and an example of the analysis of an incident.)

Construction, Use and Analysis of Preliminary Rating Scale. Following analysis and categorization, the specific behaviors were utilized in the construction of a rating scale. Ineffective behaviors reported formed the level one description on the scale, and the

effective behaviors reported were utilized in the level five description whenever possible. The level three descriptions were written so as to strike a middle of the road position between levels one and five. Based on the critical incident data received, 112 rating scale dimensions emerged to form the first stage rating scale — hereafter referred to as RS-112. Content validity is based on the 550 critical incidents of student teachers' behaviors. Search was made for instruments to establish concurrent validity of rating scale items but satisfactory instruments were found not to be available.

Twenty institutions (not the identical 20 furnishing critical incidents) collecte? data from the use of the first-stage rating scale by cooperating teachers, college supervisors and student teachers. Reliability of RS-112 based on 399 scales was determined in three ways: (1) computation of the correlation of all matching college supervisor-cooperating teacher ratings (N=125 pairs), i.e., inter-rater reliability, (2) correlation of the sum of the even scores with the sum of the odd scores, i.e., split-half reliability of the grader group (N=194 persons responsible for grading student teachers) and (3) computation of the index of discriminating power of each of the items.

The Pearson product moment correlation was chosen for those analyses involving correlations. Rho was considered and discarded. The basis for this decision was that it was easier to make the assumption that the intervals in the data (rating scale and student teaching grades) were equally spaced than that the distance between ranks was equal. The median correlation was used to compare groups of correlations with each other.

The student teaching grade was used as a criterion measure of success in student teaching. Standardization of student teaching grades was implemented by a z-score conversion employing mean scores on the rating scale and mean student teaching grades for each institution and the total sample.

Production, Use and Analysis of Second Stage Rating Scale. In order to ascertain the items identifying those teacher behaviors most predictive of student teaching success, the second stage rating scale was constructed. Darlington's method (14) based on the work of Thorndike (30) was utilized to reduce the number of items in RS-112 to the "best" predictors of the criterion. The Darlington method yields information about the ability of an item to increase the validity of a test as determined by item validity and item-test correlation. The procedure involves (1) selecting the most valid items to form the basic test, (2) measuring the potential of each item in the pool to increase the validity of the basic test, and (3) adding several items with the highest potential to determine if in fact they do increase the validity of the test. The validity

coefficient is a multiple correlation of the items and the criterion. The Darlinton method yeilds high validity coefficients upon cross validation and with less shrinkage of items than is usual for the method of multiple regression analysis. By nature of its function, multiple regression analysis picks the "best" items from a highly correlated pool, and thereby disregards other highly inter-correlated items in the pool. With the Darlington method, those other highly inter-correlated items in the pool still have a chance of coming into the test and contributing something to its validity. Although this method was the chief analysis of the study, a regression analysis was also executed. Thirty-five items emerged from the Darlington analysis; four additional items, as well as 10 contained in the 35 items above, came from the regression analysis as significant for the evaluation of student teaching in home economics. These constituted the revised or second-stage rating scale.

Data from administration of the second-stage rating scale in participating institutions were analysed using the procedure followed for RS-112 with the exception of the Darlington and multiple regression analyses. The final form of the Darlington program for RS-112 (the 35 items as ordered by the partial correlation and validity programs) was used in the analysis of the second stage rating scale, and the 14 items emerging from regression analysis were utilized in the analysis of the second stage rating scale. The determination of the significance of the difference of correlations obtained with RS-112 data and those of RS-35 data was facilitated by use of Fisher's s-test. In addition the scores on the 35 items were summed and the sum was correlated with the student teaching grade.

Two opinionnaires were formulated, one to determine feelings of student teachers and the other the feelings of cooperating teachers and college supervisors toward the rating scale. The opinions desired related to comparison with evaluation devices presently in use, and time required to fill out the instrument. (See appendix for copies of opinionnaires.)

RESULTS

Critical Incidents. Of the 563 critical incidents collected, 550 were usable. Nearly half were reported by cooperating teachers, student teachers submitted about one-third, and college supervisors about one-fifth. Student teachers reported approximately equal numbers of effective and ineffective incidents, while both cooperating teachers and college supervisors contributed more ineffective than effective incidents; slightly less than half of the reports in the total sample were made of effective behavior.

Study of the 550 incidents revealed 958 specific behaviors. Classification according to behavioral areas of a randomly selected 15 per cent of the incidents by a panel of home economics teacher educators was largely in agreement with the authors' classifications of specific behaviors.

First Stage Rating Scales. The critical behaviors formed the basis for construction of a rating scale for evaluation of student teachers in home economics, initially consisting of 112 items. Five hundred, ninety-two rating scales were distributed for administration at the end of the student teaching period. (The Appendix contains a copy of RS-112 with inter-rater reliability, correlation with student teaching grade, and index of discrimination figures for each item noted in the margins.) Of the 405 returned, 399 (68% of rating scales sent) were usable. Student teachers completed 124 of these, cooperating teachers 139, and college supervisors completed 136. Student teachers tended to rate themselves higher than their cooperating teachers and college supervisors rated them. Cooperating teachers made more use of all levels of the rating scale than did either college supervisors or student teachers. The upper end of the instrument received greatest usage with 35 per cent in each of the top two categories (4 and 5). Approximately 20 per cent of all responses were found in level 3. About 5 per cent of the ratings were either "no observation" or "no answer".

Reliability of the 112 fem instrument was ascertained by inter-rater, split-half and item discrimination methods. Inter-rater reliability on the rating scale was computed on data from 125 cases of matching college supervisor and cooperating teacher. The coefficient of reliability for all variables was .42, but when stepped-up by the Spearman Brown prophecy formula, rose to .59. The split-half method of determining internal consistency was computed on 194 graders' data; the coefficient was .97. When stepped-up by the Spearman Brown prophecy formula, this correlation became .98. Cross validation was done by dividing the entire group alternately in half. The cross validation split-half reliability for Graders A (N=97) was .96 and for Graders B (N=97) was .96. The cross validation shows that the coefficient of split-half reliability can be accepted with confidence.

The internal consistency of the first stage rating scale was also tested by the use of the Index of Discrimination. The statistic showed the amount of differentiation of the 112 ratings between the high and low 2% percent of the student teachers as determined by student teaching grade when the grader data (N=194) were analyzed. The mode for the indices of discrimination (71 percent) fell in the .20 to .29 range, low but acceptable. There were 21 items with indices below .20 putting them in the questionable class. Despite the generally low discrimination values, all these indices were positive.

The major analysis of RS-112 utilized the Darlington procedure to determine the items significant for the evaluation of student teaching in home economics. This analysis used with student grades adjusted on the basis of mean ratings of institution in which they occurred resulted in a 35 item scale having a validity coefficient (multiple correlation with criterion) of .85. The same procedure using student teacher grades as given, yielded a validity coefficient of .83. The items identified with one asterisk on the 112 item rating scale in the appendix are the 35 items resulting from the Darlington analysis.

A stepwise multiple regression analysis was also carried out on RS-112. A 14 item scale with a multiple correlation of .87 resulted. All of the 14 items had F levels significant at .01. Ten of these items had also been derived in the Darlington analysis. The items on the appended 112 item scale marked with two asterisks were those selected by the regression analysis.

Second Stage Rating Scale. Second stage rating scales (389) were distributed (to be used with new student teachers even though some of the same institutions participated). By the cut-off deadline, 276 (71 percent) of these had been completed and returned. (The Appendix contains a copy of RS-35 with inter-rater reliability, correlation with student teaching grade and index of discrimination figures for each item noted in the margins.) Of the total, 91 were completed by student teachers, 99 by cooperating teachers and 86 by college supervisors. Again the upper levels were used more heavily, with 28 percent of the ratings falling at the 5 level, 35 percent at 4 level and 26 percent at level 3. Although levels 1 and 2 were still not used extensively, a better balance of levels 3, 4 and 5 was achieved with the second stage rating scale.

Reliability of the second stage rating scale was determined by inter-rater, split-half, and item discrimination methods. Correlation of 61 matching cases of college supervisor-cooperating teacher data yielded a coefficient of .48, as compared with the inter-rater reliability correlation coefficient of .38 for RS-112. When the inter-rater correlation of .48 for RS-35 was stepped-up by use of the Spearman-Brown prophecy formula, the coefficient rose to .65 vs. the stepped-up coefficient of .59 for RS-112. However, the differences between these correlations were not statistically significant when Fisher's z-test was applied. The inter-rater reliability coefficients for each of the items in RS-35 are noted on the scale appended.

Execution of split-half reliability yielded a coefficient of .93 when carried out on the 122 graders' data. The split-half coefficient for RS-112 was .97. When Fisher's z-test was applied to determine the significance of the difference, the results were

found to be significant at the one percent level. When the split half reliability coefficient of RS-35 was stepped-up with the Spearman-Brown formula, the coefficient became .96 which was still significantly different at the one percent level from the stepped-up coefficient of .98 resulting from RS-112.

Cross validation of RS-35 reliability was carried out by dividing the grader group alternately in half. The coefficient for Graders AA (N=61) was .88 and that for Graders BB (N=61) was .93. Utilizing Fisher's z-test, comparison of split-half reliability coefficients for Graders AA and Graders BB with all Graders on RS-35 data yielded non-significant differences from the overall split-half reliability correlation of .93. The internal cross validation of RS-35 grader data indicate that the split-half reliability coefficient can be accepted with confidence.

The Index of Discrimination was computed for the 35 items in the second stage rating scale plus the additional 4 from the regression analysis using the high and low 27 percent of the student teachers as determined by student teaching grade. The mode for the cross validation data lay in the same .20 - .29 range as with RS-112, but with RS-35, 60 percent of the indices were in the .20 - .29 range whereas with RS-112, 71 percent were in that range. The .30 - .39 range now held 37 percent of the indices as compared with RS-112 where only 10 percent of the indices were in that category. In RS-35 only one item (3 percent) had an index below .20 and thus was questionable compared with 21 items (19 percent) on RS-112. The findings show that the items on RS-35 had better discriminating power than those on RS-112. As with the RS-112 data, all discrimination indices, although low, were positive.

The comparison of the student teacher's perception of herself with ratings of college supervisors and of cooperating teachers for RS-35 data yielded correlations of .26 (N=60 matching pairs) and .21 (N=70 matching pairs) respectively. The comparable figures for RS-112 were .22 and .29; there was no significant difference between the correlations resulting from the two data collections.

The validity coefficient (multiple correlation with student teaching grade) resulting from resubmitting the Darlington order and program on the 35 item second stage rating scale data was .78. This was not significantly different from that of .85 obtained with RS-112 data. An interesting facet of this analysis was that the validity coefficient built to .84 with 14 items. Table 1 presents the validity coefficients for each item in RS-35.

TABLE 1. VALIDITY COEFFICIENTS OF ITEMS IN RS-35 IN ORDER DETERMINED BY ANALYSIS OF RS-112

Order Number	Item Number	Validity Coefficient
1	20	.67

34	16	•79
35	30	.78

Stepwise multiple regression analysis using the 14 items that were derived from the multiple regression analysis of RS-112 was carried out. Five items emerged with a multiple correlation of .85. There was no significant difference between the multiple R .89 obtained for fourteen items from RS-112 data and the .85 obtained from the five items from RS-35 data.

An index of validity was secured by correlating the summed scale scores for RS-35 with the adjusted and with the unadjusted student teaching grades. The resultant correlations were .84 for the adjusted grade and .79 for the unadjusted student teaching grade.

Opinionnaire Data. Sixty percent of the college supervisors and approximately half of the cooperating teachers reported use of a rating scale as the present instrument for measuring a student teacher's performance. Some of these used descriptive categories; others used descriptive adjectives as superior, good, poor.

When asked whether their present instrument or RS-35 provided a better basis for grading the student teacher, about half of the college supervisors and cooperating teachers felt that RS-35 was superior. Approximately a third of the cooperating teachers and somewhat more than a third of the college supervisors thought that both instruments provided the same basis.

About a fourth of the cooperating teachers and one third of the college supervisors felt that RS-35 took less time to complete than the rating scale they were presently using. Approximately half felt that RS-35 and the presently used scale took about the same length of time to complete, and slightly more than a fifth of the cooperating teachers and slightly less than a seventh of the college supervisors thought the scale they were presently using required less time to complete. The majority of respondents had no objection to the amount of time required to fill out the instrument and noted that 11-20 minutes was enough:

In general both cooperating teachers and college supervisors felt RS-35 and their own scales were equally easy to use. Only one fourth of the cooperating teachers and a fifth of the college supervisors thought that their own rating scale was easier to use.

When pressed to make the decision as to which instrument they thought better - all things considered - more than half the college supervisors and cooperating teachers said RS-35 was better. However, slightly more than a third of both college supervisors and cooperating teachers felt that the scale they were using and RS-35 were of the same quality.

Approximately two-thirds of the cooperating teachers and college supervisors stated that if RS-35 were available for their continued use, they would use it. Approximately one fourth said they would use RS-35 but made some qualification.

Student opinionnaire data indicated that the student teachers did not object to the length of time required to fill out the rating scale - again for the majority, the time required was 11-20 minutes. When asked to check their feelings about using RS-35, more than half of the student teacher responses pointed up the positive and objective basis for looking at performance. About one fifth of the responses indicated they felt that it was professionally important, and one fifth of the responses centered on the quickness with which the scale could be completed. Very few student responses were negative; those that were indicated a dislike for rating self on any instrument.

DISCUSSION

As the sample in this study was limited to those institutions that agreed to participate, the results can only be applied to that group. However, it is felt that a diversity of colleges and universities participated in the study and that the rating scale would yield similar results with other samples.

Critical Incidents. It was noted that the cooperating teacher reported the most critical incidents, nearly one half of those reported. The student teachers submitted somewhat less than one third and the college supervisors contributed somewhat less than one fifth. The fact that cooperating teachers contributed the most critical incidents can probably be attributed to their being on the job with the student teachers each day and to their continual observation of student teachers' behavior. The college supervisors contributed fewest critical incidents, very leady due to her more limited contact with the student teacher during the student teaching experience.

For the total sample, slightly less than half of the reports were made of effective behaviors. Perhaps more ineffective behaviors were reported because one has more of a tendency to note and report ineffectiveness. This finding however was not true for student teachers who reported an equal number of outstandingly effective and ineffective behaviors.

On categorizing the critical incidents the classification with the most number of incidents reported was found to be "Adaptation to Students' Level". Nearly a tenth of the total number of incidents fell in this category. Of these 88 critical behaviors, about three-fourths indicated ineffective behavior. These data indicate a need for better acquainting the student teachers with the student they will teach.

Three other categories in the top ten frequency also contained a greater number of ineffective than effective behaviors. "Teacher Direction and Supervision" ranked third; there was a preponderance of five to one ineffective incidents. "Accuracy and Conceptual Development of Subject Matter" also included a majority of ineffective behaviors reported, as did "Organization of Time: Classroom".

Three categories included approximately equal numbers of effective and ineffective behaviors reported. These categories were, "Use of Techniques and Methods", "Ability to Obtain Student Involvement", and "Classroom Control".

Three categories included reports of more effective than ineffective behaviors. These categories were: "Behavior in Emergency or Unexpected Situations". "Use of Motivation/Interest Approach", and "Personal Qualities".

First Stage Rating Scale. In the distribution of ratings on RS-112 the greatest percentage for "no answer" and "no observation" cells was reported by the college supervisor. This was probably due to the fact that the college supervisor visited the student teacher only occasionally and did not, therefore, have enough information to make some of the ratings. The cooperating teacher reported the next largest number of "no answer" and "no observation" reports, and the student teacher the least. This should be expected as the student teacher was rating herself, and therefore she would be in possession of more information about her performance as she perceived it.

The greatest percentage of missing observations was in the item describing rapport with parents. This finding may be due to the lack of contact of student teachers with parents. Other missing observations were in the categories dealing with performance in supervision and classroom control, care of the department, rapport with faculty, extra curricular activities, and professional attitude and judgment. The nature of these categories may account for difficulty in rating.

The student teacher tended to rate herself higher than did the cooperating teacher or the college supervisor. Perhaps student teachers were disposed to be generous in their self appraisals as they had survived three or more years of academic work and any screening of candidates for student teaching. If they viewed academic achievement and student teaching performance as requiring similar effort, the halo effect would carry over.

In the item analysis of RS-112 data the mode for the indices of discrimination lay in the .20 - .29 range, low but acceptable. Possibly the reason for low discrimination is that many incompetent prospective teachers are diverted into other areas before the student teaching experience. Secondly, perhaps student teachers tend to be a homogeneous group. There was not much range in student teaching grades between the high and low groups.

The correlation of college supervisor-student teacher ratings by institution ranged from -.06 to .49, averaging .22, indicating that student teachers viewed their performance differently from the college supervisors. The averaged correlation of cooperating teachers and student teachers ratings yielded a coefficient of .29. The figure indicated a slightly better agreement of cooperating teacher and student teacher than of college supervisor and student teacher.

Second Stage Rating Scale. Analysis and refinement of RS-112 yielded the second stage rating scale, RS-35 with at least one item in each of the ten major behavior categories. Again the college supervisors reported the greatest number of "no answer" and "no observation". The cooperating teacher had submitted a lesser percentage and the student teacher the least. This was the same trend as had been noted on the RS-112 data. The percentage for "no observation" and "no answer" was considerably lower with the second rating scale for all three groups. This finding can probably be attributed to the statistical procedure which culled out the presumably less important and less frequently seen behaviors.

The student teacher still tended to rate herself higher than did the cooperating teacher or college supervisor. With the RS-35 analysis it was impossible to determine whether cooperating teachers or college supervisors made more use of all levels on the rating scale as the percentage for these two groups was very similar; whereas in RS-112 the cooperating teachers made most use of all levels. The selection of items on RS-35 is probably responsible for this change.

Comparisons of RS-35 Items with Qualities of "Good" Teachers as Reported in the Literature. Some characteristics of "good" teachers as reported in the literature reviewed for this study emerged in the critical incidents, survived the eliminating due to statistical analysis of RS-112, and appear in the final version of the rating scale.

Teacher enthusiasm appeared in the second stage rating scale. Mastin (19) studied teacher enthusiasm and found that students learned more when the teacher was enthusiastic than when she was not. Enthusiasm was also one of the qualities that 44 percent of school administrators wanted in a prospective employee as researched

by Rhodes and Peckham (25). Almy and Sorenson (1) incorporated this characteristic in their rating scale for teachers; they had found enthusiasm to be one of the traits contributed most frequently by competent educators as an important teacher attribute. Peronto (24) analyzed performance records of social studies teachers and found that the "good" ones were enthusiastic.

Patience, described in one item, was found mentioned in literature reviewed only once. It was among traits contributed most frequently by competent educators and therefore, included in the Almy-Sorenson Rating Scale for Teachers (1).

Peronto (24) mentioned better speaking voice as differentiating the "good" from the "poor" teachers he studied. The item describing pronunciation and use of expressions, and the item about pitch or voice might be considered parts of Peronto's "better speaking voice" category. When Barr (7) summarized studies of teaching efficiency, he also included skill in speech.

Among the findings of Debernardi (11) and Schultz and Ohlsen (26) about "good" teachers was the ability to plan and organize work. Rhodes and Peckham (25) stated that school administrators looked for a prospective teacher who had ability to plan and motivate lessons. Perhaps the planning ability mentioned by these investigators was similar to some of the behaviors mentioned in several RS-35 items which related to lesson planning.

Barr's (7) reference to the ten skills of the "good" teacher contained one skill relating to "setting and defining goals" which was described by one of RS-35's items.

Skill in planning or asking questions was evaluated by two items. This ability was mentioned in the literature by Barr (6) and Peronto (24).

Choosing learning experiences was a skill of the "good" teacher according to Barr (7). This was described by three items in RS-35.

The planning of evaluative procedures was the subject of one item and was supported in the literature as being important for teaching effectiveness by Barr (7).

A number of investigators mentioned ability to stimulate interest or to motivate pupils. Among them were Barr (6; 7), Schultz and Ohlsen (26), and Rhodes and Peckham (25). The motivation factor was assessed by two items.

Alertness to student needs, measured by another item, was delineated by Barr (7) as an important skill of the teacher, and by Debernardi (11). The importance of knowledge and choice of subject matter for good teaching was stated by Barr (6), Barr and Emans (31), Debernardi (11), and Peronto (24). Several items assessed come of the behaviors in this area.

Instructional skill as mentioned by Barr (7) and Barr and Emans (34) and professional competence as reported by Rhodes and Peckham (25) as attributes of "good" teachers were broad terms, and numerous items or perhaps most items might be construed as fitting under these categories.

Involving pupils in classroom activities as mentioned by Schultz and Ohlsen (26) was measured by one item in RS-35.

Only one item measured classroom control; this teacher behavior was found to be one of the 10 most frequently incorporated in teacher rating scales according to Barr and Emans (31), and was mentioned by Debermardí (11).

Care of the department was the subject of one item. Barr and Emans (31) noted that this was one of the categories frequently found in teacher rating scales.

Pupil-teacher rapport characterized the "good" teacher as indicated by Barr (7), Debernardi (11), Rhodes and Peckham (25) and Hearn (11) if rapport can be equated with interest in pupils. Two rating scale items measured teacher-pupil rapport.

Professional attitude was assessed by an item in RS-35 and was said to be important by Debernard: (11). It was also found as one of the ten most frequently described categories in teacher rating scales as analyzed by Barr and Emans (31).

Ideas in the rating scale items found to be significant for the evaluation of effectiveness in student teaching that were not supported by the literature reviewed included: provision of meaningful experiences and change of pace; making available necessary and appropriate materials; provision of experiences to facilitate transfer of learning; control of movement of lesson; ability to assume full class load; preparation of assignments for students without work; reliance on cooperating teacher; assistance and participation in extra curricular activities.

Some characteristics of "good" teachers were reported in the literature but did not appear in the second stage rating scale. Barr (6) and Hearn (11) thought provision for individual differences an important characteristic of the "good" teacher. Although this behavior did not emerge in the second stage rating scale, the idea appeared in three items of the original instrument.

Barr (6) described a "good" teacher as requiring a notebook and outside reading. The keeping of a notebook tends to be a bit passe at present, and the concept of outside reading appeared in no critical incidents in this study.

The objective teacher characteristic of standing most of the period as noted by Barr (6) did not appear in any of the present research.

The concept of attractiveness or appearance was mentioned by Charters and Waples (12) and Barr and Emans (31). The study by Charters and Waples concentrated on such characteristics as carefulness, health, openmindedness, promptness, refinement, and thrift. Barr and Emans (31) also listed health. Since these are teacher characteristics and not behaviors involved in the teaching process, the concepts did not emerge in the present study.

Personal habits, a rather nebulous designation, was enumerated by Barr and Emans (31) as a characteristic of a "good" teacher. Since it is difficult to know what these two men had in mind, it is impossible to seek comparisons in this research.

Hatcher (18) found that "good" teachers cooperated extensively with other departments and gained the cooperation of other faculty members in their programs. While this idea did not emerge in the second stage rating scale, it appeared in the initial set of items.

Knowledge of mental hygiene was listed as an important characteristic of the "good" teacher by Peronto (24). This teacher characteristic, not behavior, was not enumerated in the present research.

CONCLUSIONS

This study has demonstrated that a valid, reliable and useful rating scale has been constructed for the evaluation of student teaching in home economics. Critical incidents collected from a diverse sample of cooperating teachers, college supervisors, and student teachers provided an empirical base for construction of the rating scale.

Administration and analysis of a second stage rating scale, RS-35, yielded almost completely satisfactory cross validation of results of RS-112, the first rating scale constructed. The overall split-half figures for the two scales were in the 90's indicating a high degree of consistency with which any participant rated.

Item discrimination indices for RS-35 were better than those for RS-112, but the mode for both instruments was the .20 to .29 range. Perhaps the discrimination indices were low because potentially low student teachers were directed out of the program before the student teaching experience.

Inter-rater reliability coefficients were not significantly different for RS-35 and RS-112. Although one would like to see agreement higher, .59 and .65 are not unacceptable figures.

The second stage scale was said to require generally less than twenty minutes to complete. Approximately two thirds of cooperating teachers and college supervisors said that they would use the scale if it were available for continued use. Approximately one fourth made some qualifications about continued use of the scale.

The method followed in the development of the scale certainly has merit and could beneficially be adopted by rating scale constructors in other fields and for other purposes.

The diverse types and geographical locations of institutions in the sample, and satisfactory cross validation suggest the findings of the study would probably apply to the evaluation of most home economics student teachers.

SUMMARY

The primary concern of this study was the construction of a rating scale for the evaluation of student teaching in home economics, in particular those aspects that are critical in student teaching performance. The problem was approached by means of the critical incident technique. Five hundred and fifty usable reports of outstandingly effective or ineffective student teacher behaviors (958 critical behaviors) were collected from college supervisors, cooperating teachers and student teachers; these were categorized according to specific behaviors, and a randomly selected 15 percent of the data submitted to a panel of home economics teacher educators to check agreement in classification. The researchers and the panel were in agreement 66 percent of the time.

The critical behaviors provided a valid base for a rating scale; they were used to describe levels of quality on a five point continuum of 112 unidimensional items. Tested in the field by a self selected sample, percentage distribution of 399 ratings showed 70 percent in levels 4 and 5. Cooperating teachers made the greatest use of all levels. Student teachers tended to rate themselves higher than either cooperating teachers or college supervisors rated them.

G

Reliability of the instrument was tested by inter-rater, splithalf, and item discrimination methods. The inter-rater correlation stepped-up by use of the Spearman-Brown prophecy formula was .59 for 125 matching college supervisor-cooperating teacher pairs. The stepped-up splithalf reliability coefficient was .98 for 194 graders those responsible for giving the student teaching grade. Item discrimination analysis showed a modal response or 71 percent of the indices in the .20 to .29 category - low but acceptable.

The major analysis of the first stage rating scale was the Darling:on program which involved partial correlations and validity coefficients (multiple correlation with the criterion, student teaching grade). The grader data (N=194) had student teaching grades adjusted on the basis of mean ratings of the institution in which they occurred as compared with the overall mean ratings, to take care of the variance of grades among institutions. The resulting validity coefficient was .85 for 35 items. When the Darlington program was run with the 35 items and the student teaching grades as given, the resulting coefficient was .83.

A stepwise multiple regression analysis was carried out which yielded fourteen significant items with a multiple R of .87. Ten of these items had appeared from the Darlington analysis; the four not so generated were included with the 35 items in order to examine their cross validation performance.

The second stage rating scales and opinionnaires were administered to a self selected and independent sample. By the deadline for data collection, 276 rating scales had been returned. The same analysis as delineated for RS-112 was carried out. The difference between correlation coefficients was tested using Fisher's z.

The greatest percentage of ratings fell in level 4 while levels 3 and 5 tended to be almost equal, indicating RS-35 had a better distribution of ratings than RS-112. As with RS-112, student teachers tended to rate themselves higher than either cooperating teachers or college supervisors rated them. With RS-35 no one group could be said to have made use of all scale levels.

The stepped-up inter-rater coefficient for RS-35 was .65, not significantly different from the .59 of RS-112. The stepped-up split-half reliability correlation was .96 which was significantly different at the one percent level from .98 for RS-112. However, the internal cross validation of RS-35 split-half correlation yielded results not significantly different from those of the whole group. Item discrimination was better than that found for RS-112, but the mode was still in the .20 to .29 range.

Running the Darlington program on RS-35 data yielded a validity coefficient of .78 which was not significantly different from the figure of .85 for RS-112. However, the figure of .73 which resulted from use of the unadjusted student teaching grades was significantly different at the five percent level from .83 for RS-112.

When the 14 items generated from the stepwise regression analysis of RS-112 were used in the analysis of RS-35, five of these items emerged with a multiple correlation of .85 as compared to .87 with the 14 items in RS-112 analysis.

An index of validity was secured by correlating the summed scale scores for RS-35 with the adjusted student teaching grade which yielded a correlation of .84. When the same procedure was followed with the unadjusted student teaching grades, the correlation was .79.

The majority of cooperating teachers and college supervisors reported use of a rating scale to evaluate student teaching. About half of the supervisors and cooperating teachers felt that RS-35 provided a better basis for grading and somewhat more than half thought it had better all around qualities than their presently used instrument. Most who used the scale found that it took no longer than twenty minutes to complete; they did not object to the time required for its use. When queried about continued use of the rating scale if it were available, approximately two thirds of cooperating teachers and college supervisors said they would use it, and approximately one fourth gave their qualified assent. More than half the student teachers considered that the objective basis RS-35 provided for looking at their behavior was important. Approximately a fifth thought it professionally important, and another 20 percent stressed the ease and quickness with which RS-35 can be used. Negative student teacher reactions were very few.

Recommendations

Since RS-35 performed quite satisfactorily, it deserves further refinement and use. If a short rating scale is desired, for an almost equivalent correlation with student teaching grade, the five items emerging from the multiple regression analysis are recommended. (See items 14, 28, 31, 35, 39 in RS-35, appended.)

Should anyone be interested in a further refinement, the addition of a descriptive level between three and five would be beneficial since the upper end of the scale received extensive use. Possibly the rating system could be changed to one through ten, to enable the raters to differentiate more at the top of the scale. This would not be recommended, however, unless the additional descriptive level suggested were added.

A place should be made on the rating scale for comments by the rater regarding growth of the student teacher. This is seen as a means of making the evaluation more personal.

Regarding the use of the rating scale, its recommended use is at the middle and conclusion of the student teaching period by all involved in the program. The scale should be used independently by the college supervisor, cooperating teacher, and student teacher and should be followed by a conference so that the student teacher's ability and progress can be evaluated effectively. Use at the recommended two times would necessitate a second column for rating. Use at the suggested times is not meant to preclude evaluation throughout the student teaching period.

A page of pertinent information on the development of the rating scale has been written. (See Appendix.) Accompanying the scale, this will give users some concept of the basis for its construction and of its quality.

Suggestions for further study arising from this research are:

- 1. to determine ways to promote growth in the student teacher in the areas emerging in the scale and especially in the five areas resulting from the multiple regression analysis.
- 2. to train raters (possibly by analysis of a film of student teacher performance) in the use of the scale in an attempt to bring about better agreement.
- 3. to develop other means of evaluating student teaching performance, e.g., use the same procedure to develop a rating scale to be used by pupils to evaluate the student teachers and compare results with those from this scale.
- 4. to use the scale in the evaluation of teaching performance of first year teachers.
- 5. to develop another scale for the evaluation of first year home economics teachers following this methodology.

GLOSSARY

- Student Teacher a college or university student who teaches and carries out associated duties in a teaching center affiliated with the college; occasionally abbreviated as ST
- Cooperating teacher or supervising teacher a school staff member
 who assists the college or university by directing
 the student teacher in her student teaching experience; abbreviated as CT
- College supervisor the university staff member who visits the student teacher in the student teaching center and who with the cooperating teacher guides and evaluates the student teacher's performance; abbreviated as CS
- Student teaching center a school which provides its facilities for the student teaching experience
- Critical incident a critical incident involves the description of a student teacher's behavior that has resulted in her being either outstandingly effective or ineffective during the period of practice in which she gradually assumes the role of teacher
- Grader group composed of all individuals who were responsible for grading student teachers
- First stage rating scale Original rating scale of 112 items; abbreviated as RS-112
- Second stage rating scale Revised instrument containing 35 items plus four; abbreviated as RS-35

LETTER TO PROSPECTIVE PARTICIPANTS

Home Economics Education Martha Van Rensselaer Hall Cornell University Ithaca, New York 14850

Dear

I am asking cooperating teachers, college supervisors, and student teachers to assist in research that is being conducted as a part of a larger project for the Ph.D. degree. Approval for your cooperation has been secured from the head of the home economics division at the college or university with which you are connected. The study will ultimately be concerned with the construction of an instrument to evaluate student teaching in home economics. For the initial phase of this research, a study of the requirements of student teachers' behavior will be collected. The description of the technique that will be used in this study is:

A critical incident involves the description of a student teacher's behavior that has resulted in her being either outstandingly effective or ineffective in a period of practice in which she has the opportunity of integrating the various learnings of her professional preparation and thereby increasing her perspective of the total role of a home economics teacher. Some of the areas in which this behavior might occur are:

- 1. performance in the classroom
- 2. preparation for teaching
- 3. relationships with faculty
- 4. relationships with parents
- 5. relationships with cooperating teachers
- 6. extra curricular activities
- 7. duties associated with teaching

Your assistance is vitally needed in determining these incidents. You are asked to supply the names of the persons involved in the situation so that the critical incidents that are described by the cooperating teacher, college supervisor, and student teacher may be matched. All data will be coded and handled confidentially; no names will be used in the report of the study. This study is to continue during the month of May.

Please describe the situation in terms of what was actually observed or done rather than inferred from what you saw or did. Do not state for example, that "the lesson plans of the student teacher, Miss Jones, the student teacher, did not organize the content logically, learning experiences were not varied, objectives were not stated in behavioral terms, etc." Another situation reported in terms of inferred behavior is: "I (the student teacher reporting) seem to favor Susan." This could better be described by stating: "I call upon Susan almost every time she raises her hand even when others volunteer."

Try to give as detailed a description as possible of the behavior rather than listing generalized traits or abstractions. Attempt to be objective and unbiased in your reporting.

Incidents of outstandingly effective and ineffective student teacher behavior should be reported as they occur. You will probably not find them occurring at any regular interval. Remember, the incident must involve some specific aspect of the student teacher's behavior that makes her outstandingly effective or ineffective in student teaching. Please report the situations without conferring with the other individuals involved.

The attached sheets contain a sample of a type of incident that you may be contributing this month. The format will remain the same as you supply information about the situations you observe. Please become familiar with the information sheet and fill it in as soon as an incident involving effective and ineffective student teaching behavior occurs. Do not wait. Each time an incident occurs, record the incident at once, and do not go back and change any of your statements later. When you have four or five incidents recorded, send them in the stamped, self addressed envelope provided to:

Miss Joan Gritzmacher Home Economics Education Martha Yan Rensselaer Cornell University Ithaca, New York

If you should need additional forms for recording the data, you may use a sheet of paper and number the items or request additional forms from me at the above address.

I will be most appreciative of your cooperation in this study.

Sincerely yours,

Enc.

MATERIALS FOR COLLECTING CRITICAL INCIDENTS

SAMPLE CRITICAL INCIDENT OF STUDENT TEACHER'S BEHAVIOR

Description-definition of critical incident: A critical incident involves the description of the student teacher's behavior that has resulted in her being either outstandingly effective or ineffective during the period of practice in which she gradually assumes the role of teacher. Some of the areas in which this behavior might occur are:

- l. performance in the classroom
- 2. preparation for teaching
- 3. relationships with faculty
- 4. relationships with parents
- 5. relationships with cooperating teacher
- 6. extra curricular activities
- 7. duties associated with teaching
- 1. Name the people involved in the situation. Place an X before your name.

College Supervisor Mrs. Ready
Cooperating Teacher Mrs. Childs
X Student Teacher Miss Rider
Other (Specify)

- 2. Date the situation occurred 2/24/65
- 3. School in which the situation took place Horace Mann High School
- Description of the situation I gave the 7th grade class a post test on their unit on Personal Relationships and found after analyzing the test that the pupils had not learned the content in a few areas. As a result I changed my lesson plans for the rest day (with the approval of Mrs. Childs) and retaught the content that the pupils apparently had not understood.
- 5. What caused the situation? Inability to recognize that I was not getting through to the pupils.
- 6. Why do you think that this behavior indicates effectiveness or ineffectiveness? When I realized that the pupils had done poorly in certain areas of the test, I decided that since this learning was important and since I had evidently not done a good job, I had better reteach the content that they had not understood in another way. I wanted the pupils to attain the objectives that had been formulated for this unit.
- 7. What action did the people named in item 1 take as a result of the incident? When I gave the pupils a test on their beginning foods work at the sid of the next week, I added a small section on the Personal Relationships content that they had done so poorly on before. This time they did much better.

SAMPLE CRITICAL INCIDENT OF STUDENT TEACHER'S BEHAVIOR

Description-definition of critical incident: A critical incident involves the description of a student teacher's behavior that has resulted in her being either outstandingly effective or ineffective during the period of practice in which she gradually assumes the role of teacher.

Some of the areas in which this behavior might occur are:

- 1. performance in the classroom
- 2. preparation for teaching
- 3. relationships with faculty
- 4. relationships with parents
- 5. relationships with cooperating teachers
- 6. extra curricular activities
- 7. duties associated with teaching
- 1. Name the people involved in the situation. Place an X before your name.

College Supervisor_	Miss Green
X Cooperating Teacher	Miss Smith
Student Teacher	Miss Brown
Other (Specify)	

- 2. Date the situation occurred 2/15/65
- 3. School in which the situation took place Gresley High School
- 4. Description of the situation Miss Brown was ignoring some of the work habits of the pupils in her 7th grade foods class. They were not choosing the proper measuring tools and were not sifting and leveling the flour correctly. Dishes and utensils in some cases were washed in dirty dishwater and equipment was occasionally put away in the wrong places.
- 5. What caused the situation? Miss Brown had not reviewed with the pupils procedures and standards before the lab. She had not considered work habits when writing objectives, and evaluative plans included only analysis of the final product and a paper-and-pencil test mainly on principles.
- 6. Why do you think that this behavior indicates effectiveness or ineffectiveness? Full use of learning experiences is not taking place. Work standards are important aspects involved in food preparation.
- 7. What action did the people named in item 1 take as a result of the incident? Miss Brown and I discussed the laboratory as well as other classes in a conference after school. As a result Miss Brown planned to have the pupils evaluate their learnings with emphasis on work habits during the next class session.

INFORMATION SHEET FOR REPORTING CRITICAL INCIDENTS OF STUDENT TEACHER'S BEHAVIOR

Description-definition of critical incident: A critical incident involves the description of a student teacher's behavior that has resulted in her being either outstandingly effective or ineffective during the period of practice in which she gradually assumes the role of teacher. These incidents may be rather small as illustrated by the example involving evaluation of student learnings in the unit on Personal Relationships or relatively broad as illustrated by the example involving work habits of pupils in foods lab. Some of the areas in which this behavior might occur are:

- 1. performance in the classroom
- 2. preparation for teaching
- 3. relationships with faculty
- 4. relationships with parents
- 5. relationships with cooperating teacher
- 6. extra curricular activities
- 7. duties associated with teaching

1.	Name the people involved in the situation. Place an X before your name. College Supervisor Cooperating Teacher Student Teacher Other (Specify)
2.	Date the situation occurred
3.	School in which the situation occurred
4.	Description of the situation
5•	What caused the situation?
6.	Why do you think that this behavior indicates effectiveness or ineffectiveness?
7.	What action did the people named in item 1 take as a result of the incident?

SAMPLE ANALYSES OF CRITICAL INCIDENTS OF STUDENT TEACHER BEHAVIOR

Incident #270

Reporter: ST

- 4. A laboratory class-demonstration of an oven baked meal the preparing of Swiss Steak. I was extremely nervous and uncertain time ran out and the Swiss Steak was not even in the oven. The vegetables were never prepared as a demonstration. The planned student-teacher time table for procedure the following day did not even get started.
- 5. I have never prepared Swiss Steak before and had not rehearsed the demonstration, therefore I was very unsurce of what steps to take, how to do it, and whether or not it was coming out right.
- 6. The students I know sensed this uneasiness on my part and so were inattentive. Demonstrations should be examples of "how to" as well as why and with a poor model it is impossible to know what to do on your own.
- 7. Luckily I was able to repeat the same lab demonstration that afternoon on another class. This time it moved much more smoothly also as a result of a brief noon conference with the teacher. The next day I simply outlined the procedure for the day no student-teacher cooperated time plan was made.

Incident #326

Reporter: CT

- 4. ST was aghast at her first 7th grade foods lab. It didn't take her long to see that she had overestimated their ability and underestimated the time in which they could do their work.
- 5. So much to do and only 50 min. in which to do it.
- 6. This problem is one that all foods teachers have. Everyone has to learn how to handle the individual situation. ST realized what was wrong and took care.
- 7. ST quickly made a lab sheet that was an excellent guide and a big help for the students.

CATEGORIES OF STUDENT TEACHER BEHAVIOR DERIVED FROM CRITICAL INCIDENTS

- 1. Personal Qualities
 - a. voice
 - b. poise
 - c. assumption of responsibility
- 2. Lesson Planning
 - a. utilization of knowledge of students' abilities, background
 - b. lesson goals
 - c. structuring of subject-matter (concepts, generalizations)
 - d. preparation of questions to develop students' ability to think
 - e. learning experiences
 - f. teaching aids and materials
 - g. evaluation of pupils
- 3. Functioning in a Classroom Situation
 - a. use of motivation/interest approach
 - b. adaptation to students' level
 - c. accuracy and conceptual development of subject matter
 - d. use of techniques and methods
 - e. use of teaching aids and materials
 - f. use of review
 - g. use of summary (drawing together of generalizations)
 - h. application of learnings to situations outside the school
 - i. asking questions and handling pupils' questions
 - j. evaluation of students' progress
- 4. Ability to Obtain Student Involvement
- 5. Organization of Time
 - a. classroom
 - b. student teacher work en toto
 - c. pre class preparation of aids, materials, etc.
- 6. Alertness to Classroom Activity
 - a. teacher direction and supervision
 - b. classroom control
 - c. behavior in emergency or unexpected situation
- 7. Care of the Department
- 8. Inter-personal Relationships
 - a. rapport with cooperating teacher, faculty
 - b. rapport with students
 - c. rapport with parents
- 9. Extra Curricular Activities
- 10. Professional Qualities
 - a. professional attitude and judgment
 - b. professional growth

SECOND STAGE RATING SCALE

Student Teacher	Cooperating Teacher	College Supervisor	College or University	di
Student	Coopera	College	College	Date

RATING SCALE FOR THE EVALUATION OF STUDENT TEACHERS IN HOME ECONOMICS Read the descriptions and write the number (a whole number, no fractions) corresponding to the observed behavior of the student teacher in the box following the descriptions. Use zero when there has been no opportunity to observe a specific behavior. Please fill in the blanks at the top of this page. DIRECTIONS:

NOTE: The abbreviation CT stands for Cooperating Teacher.

INFORMATION DESIGNED TO ACCOMPANY RATING SCALE IN FUTURE USE

Development of the rating scale: The items in this rating scale were based on 958 critical behaviors of student teachers reported independently by college supervisors, cooperating teachers, and student teachers. The critical behaviors were then categorized and utilized in constructing a first rating scale which consisted of 112 unidimensional items. The instrument was used independently by the three groups at the conclusion of student teaching. Three hundred and ninety-nine usable scales were returned and analyzed statistically. The major analysis sought to determine which items would significantly predict the student teaching grade; 35 items emerged from this analysis. These items then constituted the second stage rating scale; and the instrument was administered to a second sample. Two hundred and seventy-six rating scales were returned. Cross validation was quite satisfactory; some of the results of analysis of the 35 items scale arenas follows:

split-half reliability	.96
<pre>inter-rater reliability (college supervisor and cooperating teacher)</pre>	.65
validity coefficient (multiple correlation of 35 items and adjusted student teaching grades [to control for institutional variation])	.78
ditto with student teaching grade as given	.73
correlation of summed scale scores with adjusted student teaching grade	.84
ditto with student teaching grade as given	•79
time to complete the insturment: less than 20 minutes	64% of par- ticipants

For further information on the instrument, see Gritzmacher, Joan E. "Evaluation of Student Teaching in Home Economics", Ph.D. Dissertation, Ithaca, New York: Cornell University, 1967.
